

# SUPPLY & DEMAND

Supply & demand zones are price areas where institutional market participants execute orders. The large volumes provided by the orders cause sharp market movements - providing excellent buy/sell points.

## HOW TO PLOT SUPPLY/DEMAND ZONES

Supply & demand zones can be identified as consolidation areas at structure high & low points followed by large upside or downside moves. When price then trades into this area again we have a possible buy/sell zone.

To plot supply & demand zones we simply mark out the price area surrounding the consolidation & draw out a box extending to current price action. When price meets the zone once again we can identify reversal and buy/sell respective to what price action shows.

## MARK THE CONSOLIDATION & EXTEND THE ZONE BOX

**WAIT FOR TAP INTO ZONE  
SELL IF CONFIRMATION FORMS**

Supply & demand should always be used in conjunction with market structure, key levels & all the other aspects of technical analysis covered in the course. When used correctly supply & demand zones can be a powerful tool so take the time to learn how to plot them correctly.
